

Planetary Defense Lab

Background:

NASA's Planetary Defense Coordination Office (PDCO) oversees the agency's detection and ongoing tracking of asteroids and comets that could potentially pose a threat to the Earth. By continually refining measurements of an object's position and velocity on the sky through repeated observations, astronomers are able to better predict the orbital path of that object via simulations. Today, we will examine a simplified model of these simulations.

Suppose the PDCO has heard about your *stellar* performance in NSP-233 and has asked you to help them determine the risks posed by several asteroids. Your job is to run the simulations for the asteroids tabulated below and report the missing pieces to NASA. You must also determine which of the asteroids (if any) pose a direct collision threat with the Earth over the next 50 years.

Data:

ID	Asteroid Name	Perihelion Distance (AU)	Aphelion Distance (AU)	Current X Coordinate (AU)	Current Y Coordinate (AU)	Current X Velocity (AU/yr)	Current Y Velocity (AU/yr)
1	GK 9494	0.3438	3.5301	-3.4420	0.6550	-0.1003	1.4641
2	HK 1112	1.436	2.5144	1.0209	1.0154	-4.0196	4.3234
3	FC 5896	1.506	10.4412	5.442	-4.655	2.1003	0.0772
4	MV 3130		2.5947	0.5921	2.5071	1.2936	0.1527
5	Y33-T	0.3102	1.0058	-0.9991	0.0833	0.0071	-4.3312
6	Chunk Norris	1.1615	5.1331	2.442	-3.655	0.9446	2.1275
7	Bob			-1.2055	1.0788	-1.9399	-2.2785
8	JL 8066	0.2274	2.5331	2.3510	0.9330	-0.4097	1.5640
9	Jenny	0.0966	3.1872	2.8113	1.4177	-0.867	0.5309
10	Asteroid McAsteroidface	0.1724	0.8709	-0.0019	0.8709	-3.871	0.0012

(Excel sheet also available in canvas.)

Problems:

- Several asteroids on the list can be safely ruled out without worrying about simulating their orbits. Which ones? How do you know?
- Create a Fork of the Kaggle notebook [here](#) and complete the exercises below by altering the indicated cell in the notebook.

3. How close does Asteroid GK 9494 come to Earth? Report your answer in units of AU.
4. What is asteroid MV 3130's perihelion distance?
5. How close does asteroid MV 3130 come to Earth?
6. What is the semi-major axis of asteroid Chunk Norris?
7. What is the orbital period of asteroid Bob in units of years?
8. Which (if any) of the asteroids are a threat to Earth in the next 50 years? If you found any asteroids that collide with Earth, in what year will they impact?

11. Let's go back to any asteroids you found that threatened the Earth over the next 50 years. Change that asteroid's y velocity to be just 0.002 AU/yr lower than tabulated. Does this change the outcome of the simulation? That is, did you save the planet?
12. A change of 0.002 AU/yr was the difference between a civilization-destroying asteroid collision and a near miss. Does this mean it is easy to change an asteroid's orbit and save the Earth? Why or why not? Defend your position.
